

# Complexity Oblivious Network Management (CONMan)

Hitesh Ballani, Paul Francis

Cornell University

INM'06

# Network Management is a Mess

---

- ▶ Ad-Hoc
- ▶ Complex
- ▶ Error-Prone
- ▶ Expensive

Worsening situation as network complexity increases

- ▶ 80% of IT budget in enterprises used to maintain status quo [Kerravala'04]
- ▶ Configuration errors account for 62% of network downtime [Kerravala'04]

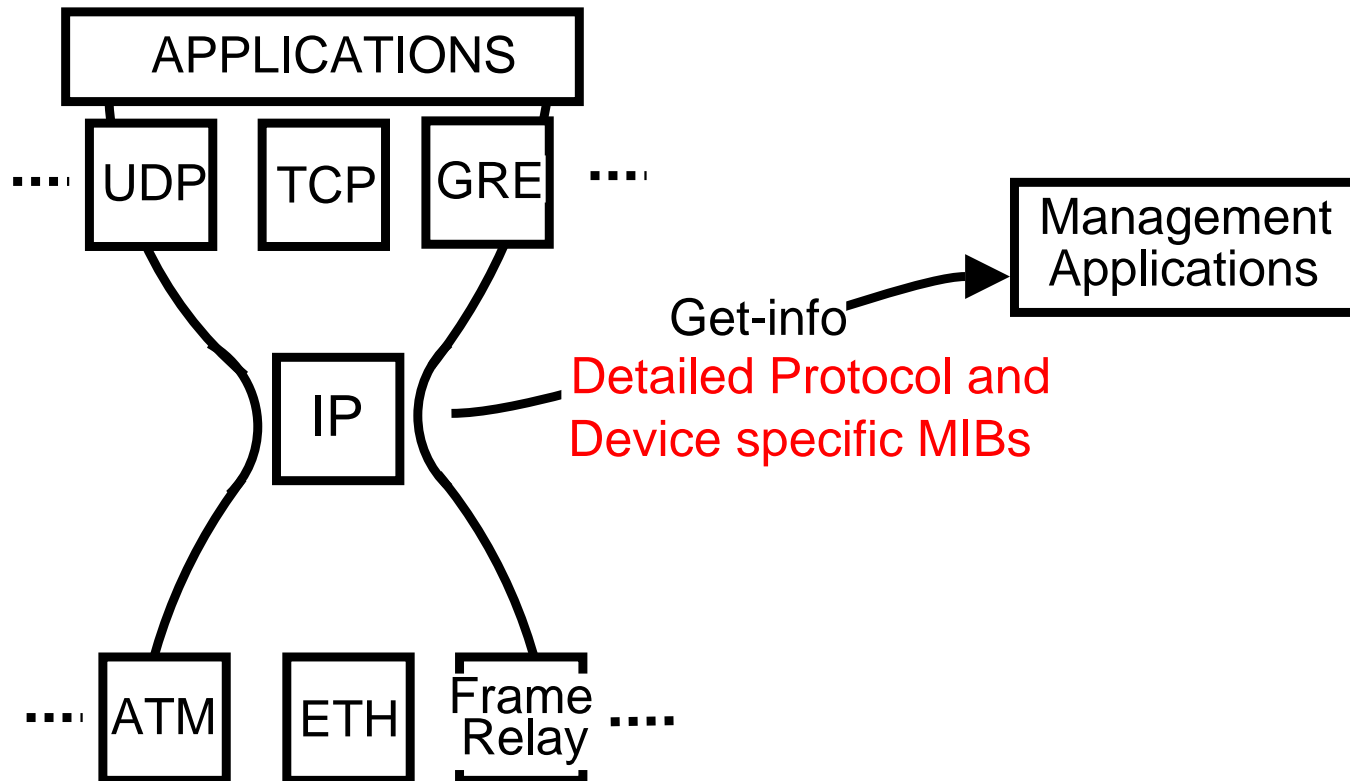

# Shortcomings of the existing architecture

---

- ▶ Dependency of the Management Plane on the Data Plane [4D, Greenberg et. al.'05]
- ▶ Control Plane Complexity [4D, Greenberg et. al.'05]  
[RCP, Caesar et. al.'05]
- ▶ . . . .

# Protocols expose their gory details

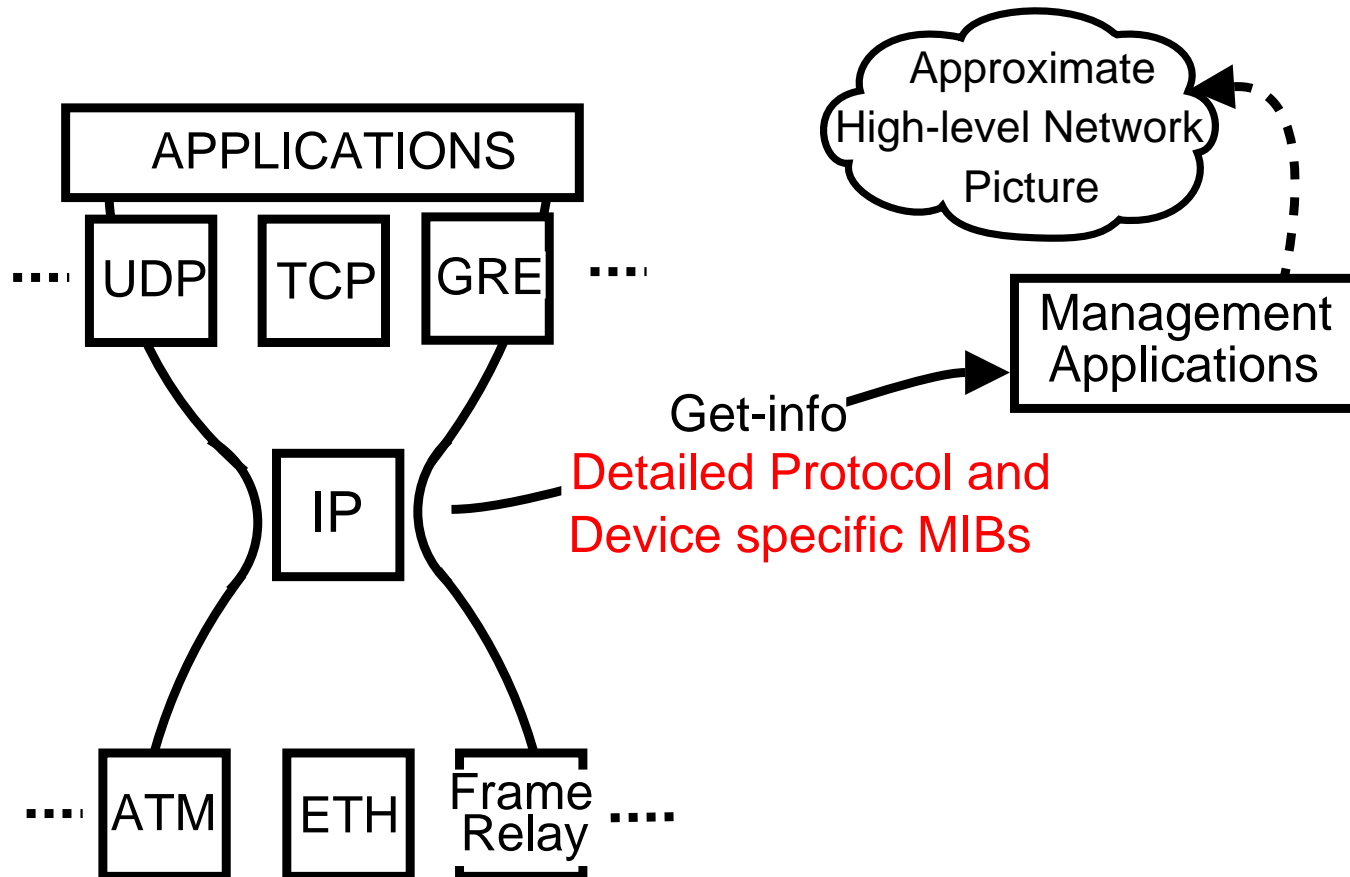

---

Hundreds of MIBs and Thousands of MIB objects

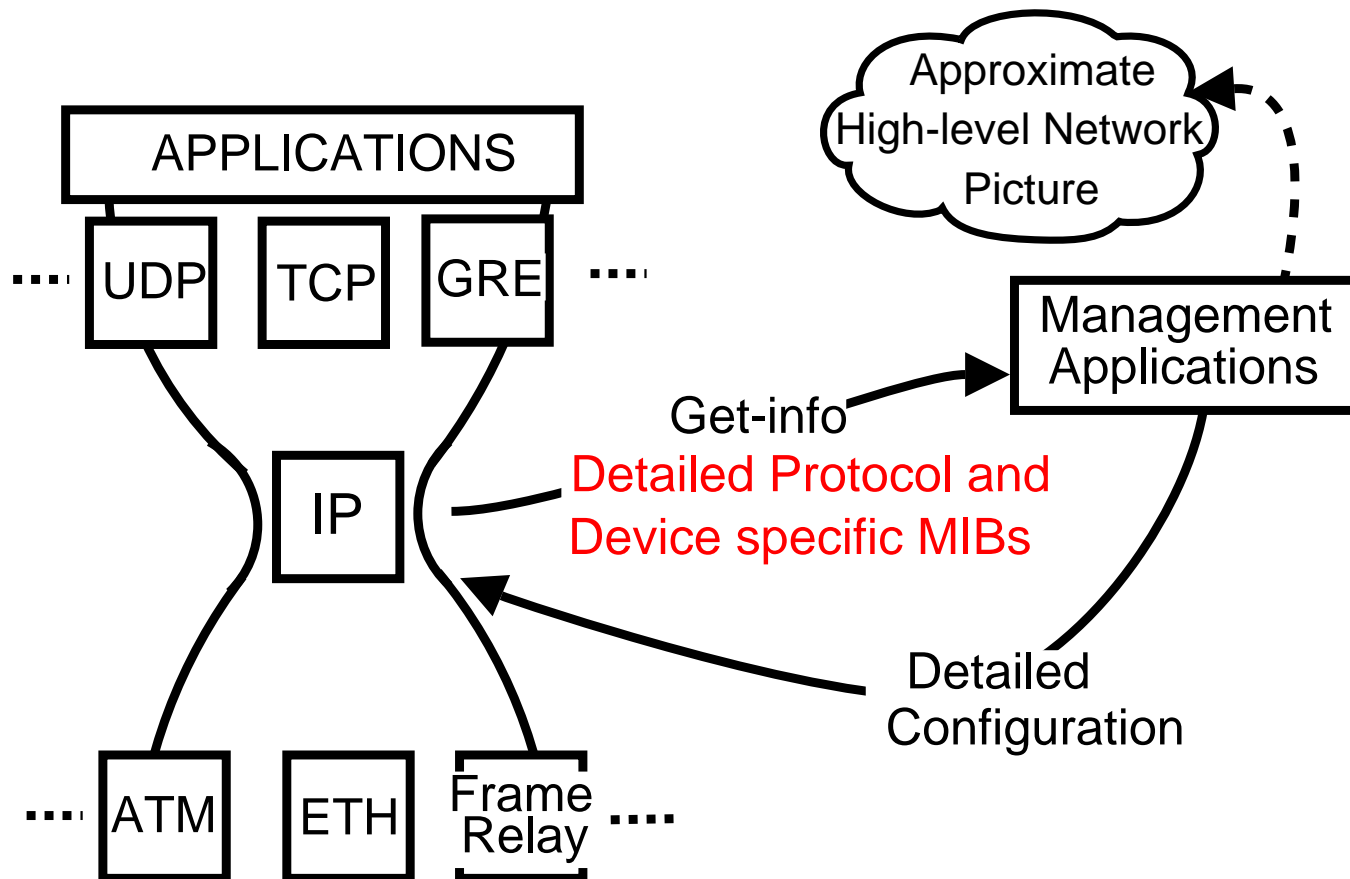

# Protocols expose their gory details

---

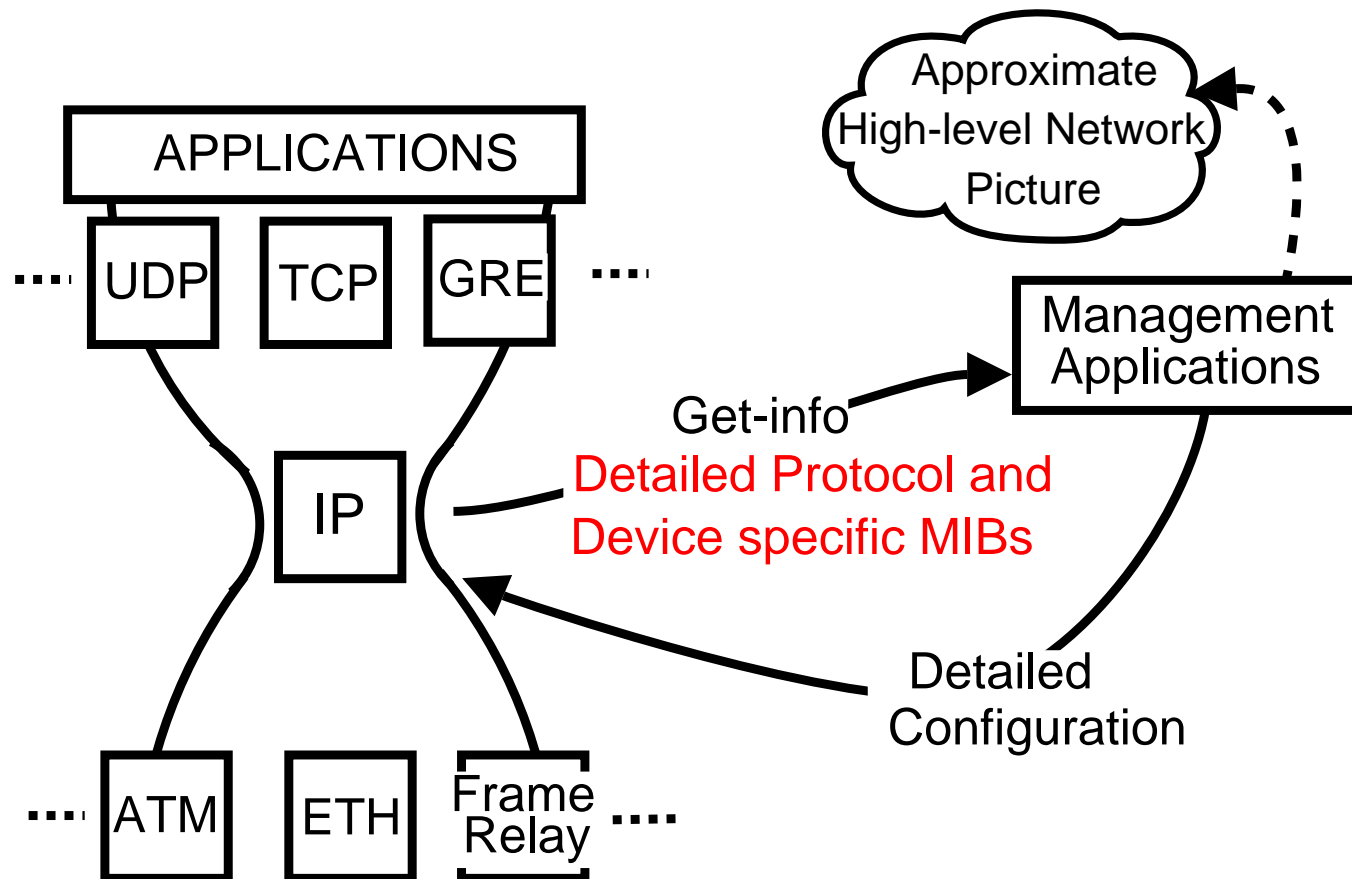

- ▶ Perception differs from reality
- ▶ Error-prone configuration
- ▶ Fragmentation of tools

# Protocols expose their gory details

- ▶ Perception differs from reality
- ▶ Error-prone configuration
- ▶ Fragmentation of tools

# Protocols expose their gory details

- ▶ Perception differs from reality
- ▶ Error-prone configuration
- ▶ Fragmentation of tools

# Complexity Oblivious Network Management (CONMan)

---

A network management architecture that aims to

- ▶ Restrict protocol complexity to their implementation

# Complexity Oblivious Network Management (CONMan)

---

A network management architecture that aims to

- ▶ Restrict protocol complexity to their implementation

## Assumptions and Caveats

- ▶ Presence of an independent management channel  
[4D, Greenberg et. al.'05]
- ▶ “Network” management; not “Service” management
- ▶ Management of data-plane protocols

# Restrict protocol details to implementation

---

Scenarios where details need not be exposed

- ▶ Key values for GRE tunnels
- ▶ Sequence numbers for GRE tunnels
- ▶ Filtering undesired packets

# Restrict protocol details to implementation

---

Scenarios where details need not be exposed

- ▶ Key values for GRE tunnels
- ▶ Sequence numbers for GRE tunnels
- ▶ Filtering undesired packets

```
ip tun add name A mode gre remote 12.8.2.2 local\  
12.8.2.1 ikey 200 okey 1001 icsum ocsum iseq oseq  
Key  
Value
```

The code block shows the configuration for a GRE tunnel. The parameters `ikey 200` and `okey 1001` are circled in red, with a red arrow pointing to the text 'Key Value' below the code.

# Restrict protocol details to implementation

---

## Scenarios where details need not be exposed

- ▶ Key values for GRE tunnels
- ▶ **Sequence numbers for GRE tunnels**
- ▶ Filtering undesired packets

```
ip tun add name A mode gre remote 12.8.2.2 local\
12.8.2.1 ikey 200 okey 1001 icsum ocsum iseq oseq
```

! Seq. No.  
! Usage

# Restrict protocol details to implementation

## Scenarios where details need not be exposed

- ▶ Key values for GRE tunnels
- ▶ **Sequence numbers for GRE tunnels**
- ▶ Filtering undesired packets

```
ip tun add name A mode gre remote 12.8.2.2 local\  
12.8.2.1 ikey 200 okey 1001 icsum ocsum iseq oseq
```

[Low Jitter/Delay] Vs [In-Order delivery] ↔ Seq. No. Usage

# Restrict protocol details to implementation

---

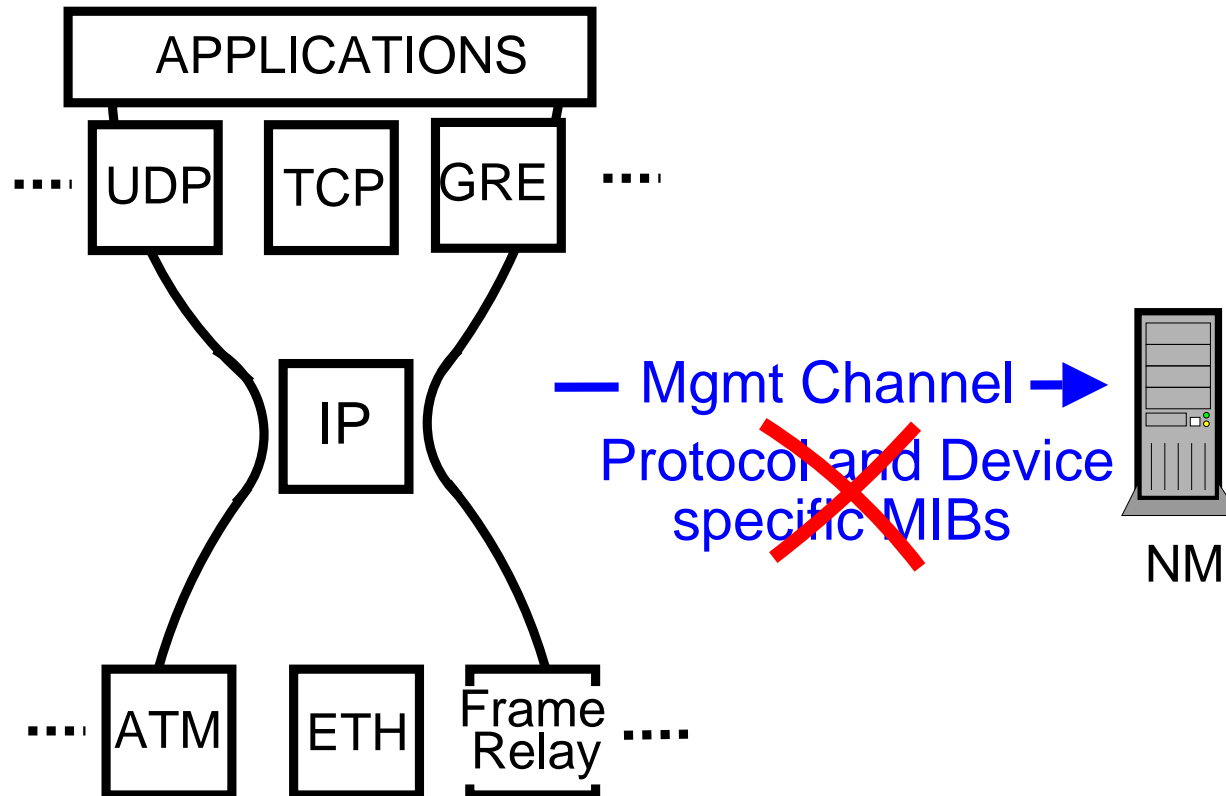

## Scenarios where details need not be exposed

- ▶ Key values for GRE tunnels
- ▶ Sequence numbers for GRE tunnels
- ▶ **Filtering undesired packets**

"Filter packets from source address 128.19.2.3 and destined to address 20.3.4.5, port 592"

# Abstract away the details

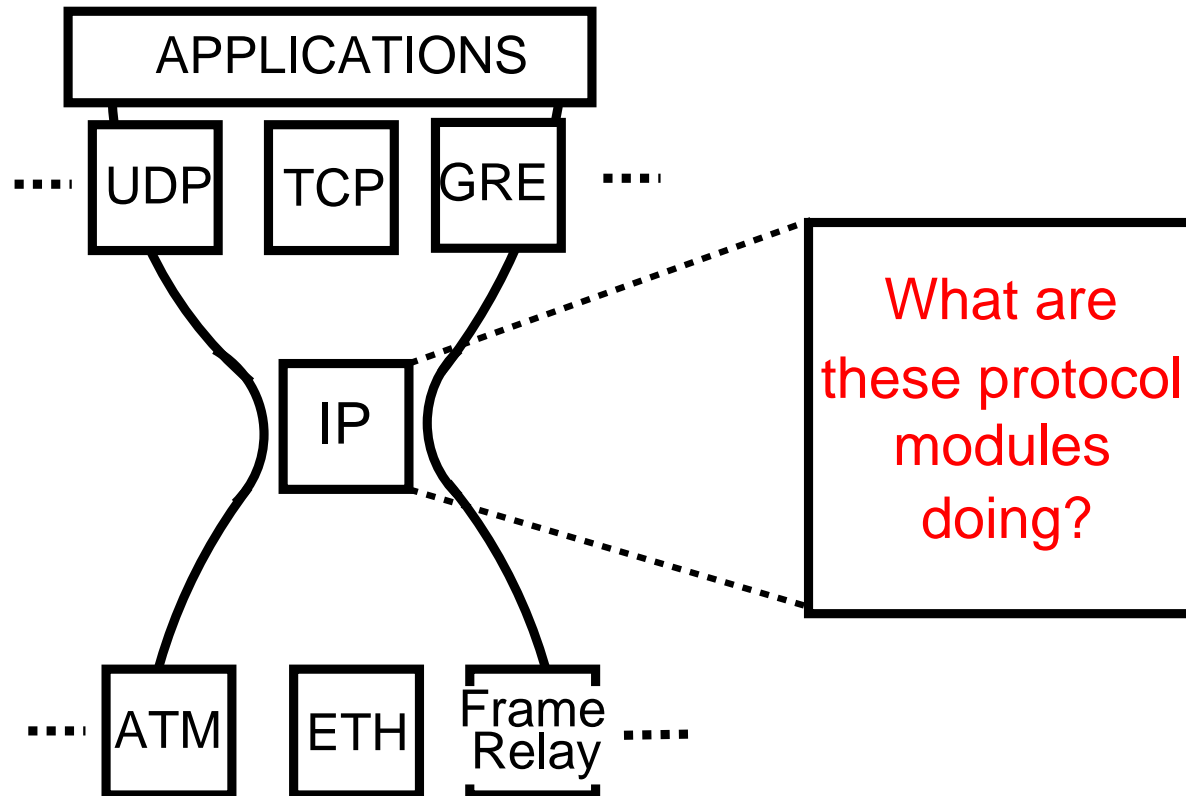

---

Protocols should not expose their gory details  
What do the protocols expose?

# Abstract away the details

---

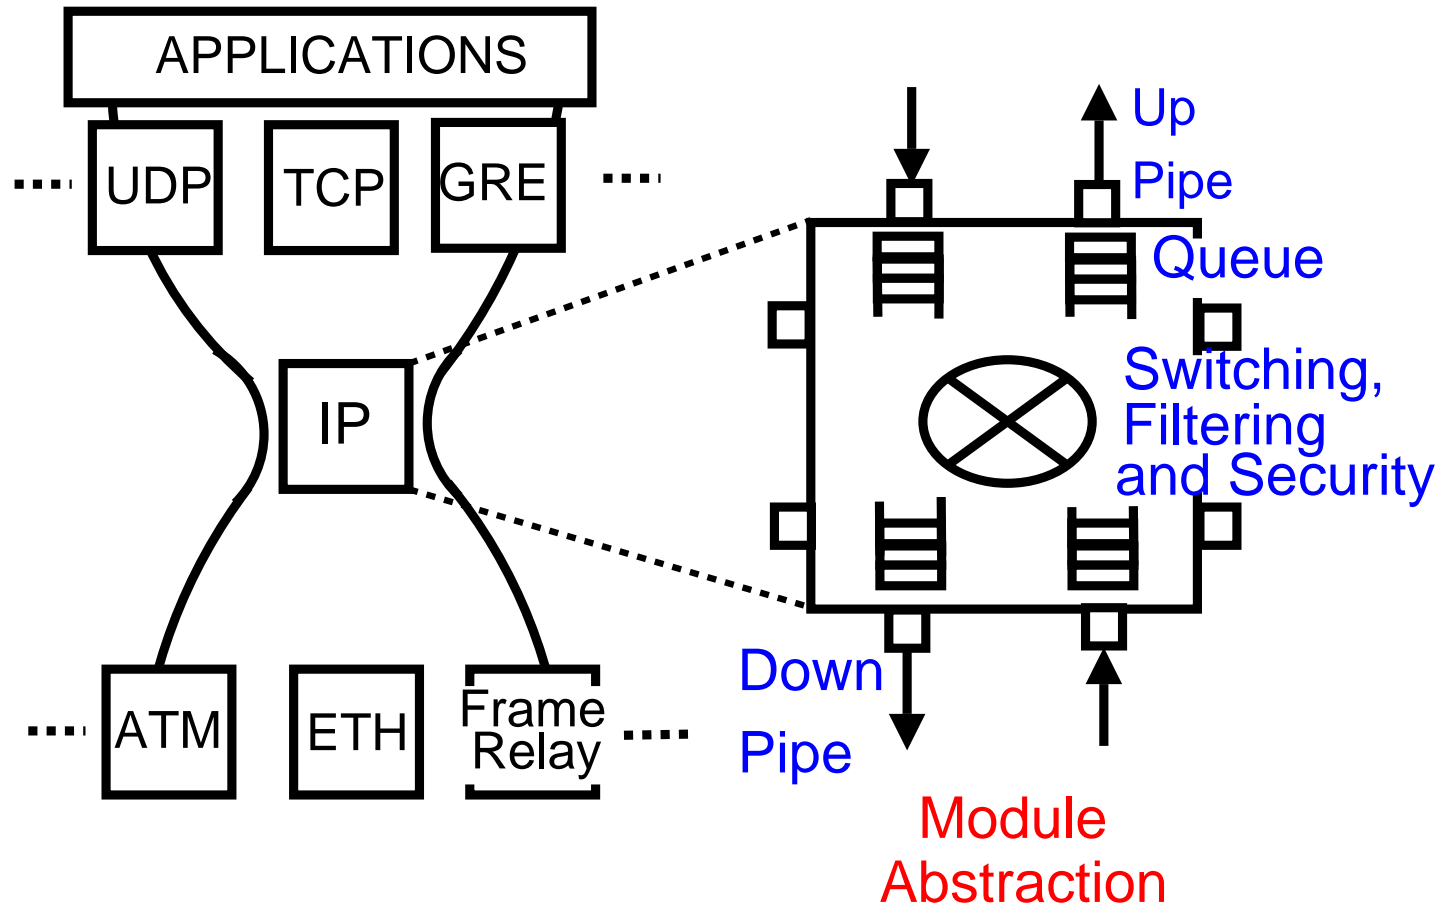

What are these protocols modules doing?

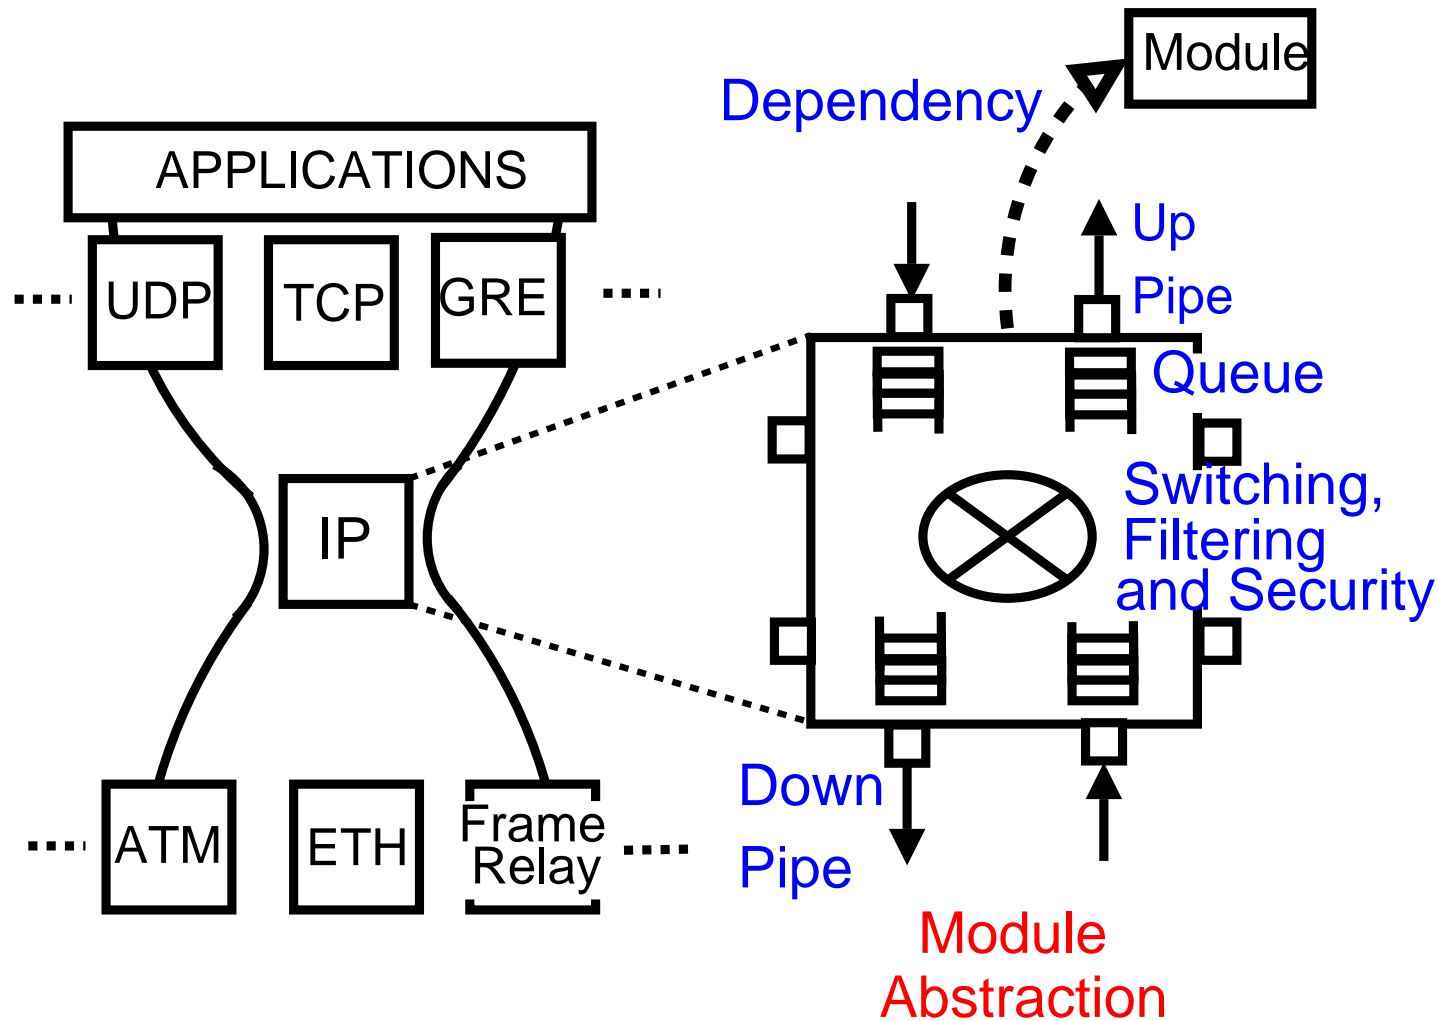

# Abstract away the details

---

What are these protocols modules doing?  
**Switching** packets under some **performance** constraints while **filtering** unwanted traffic

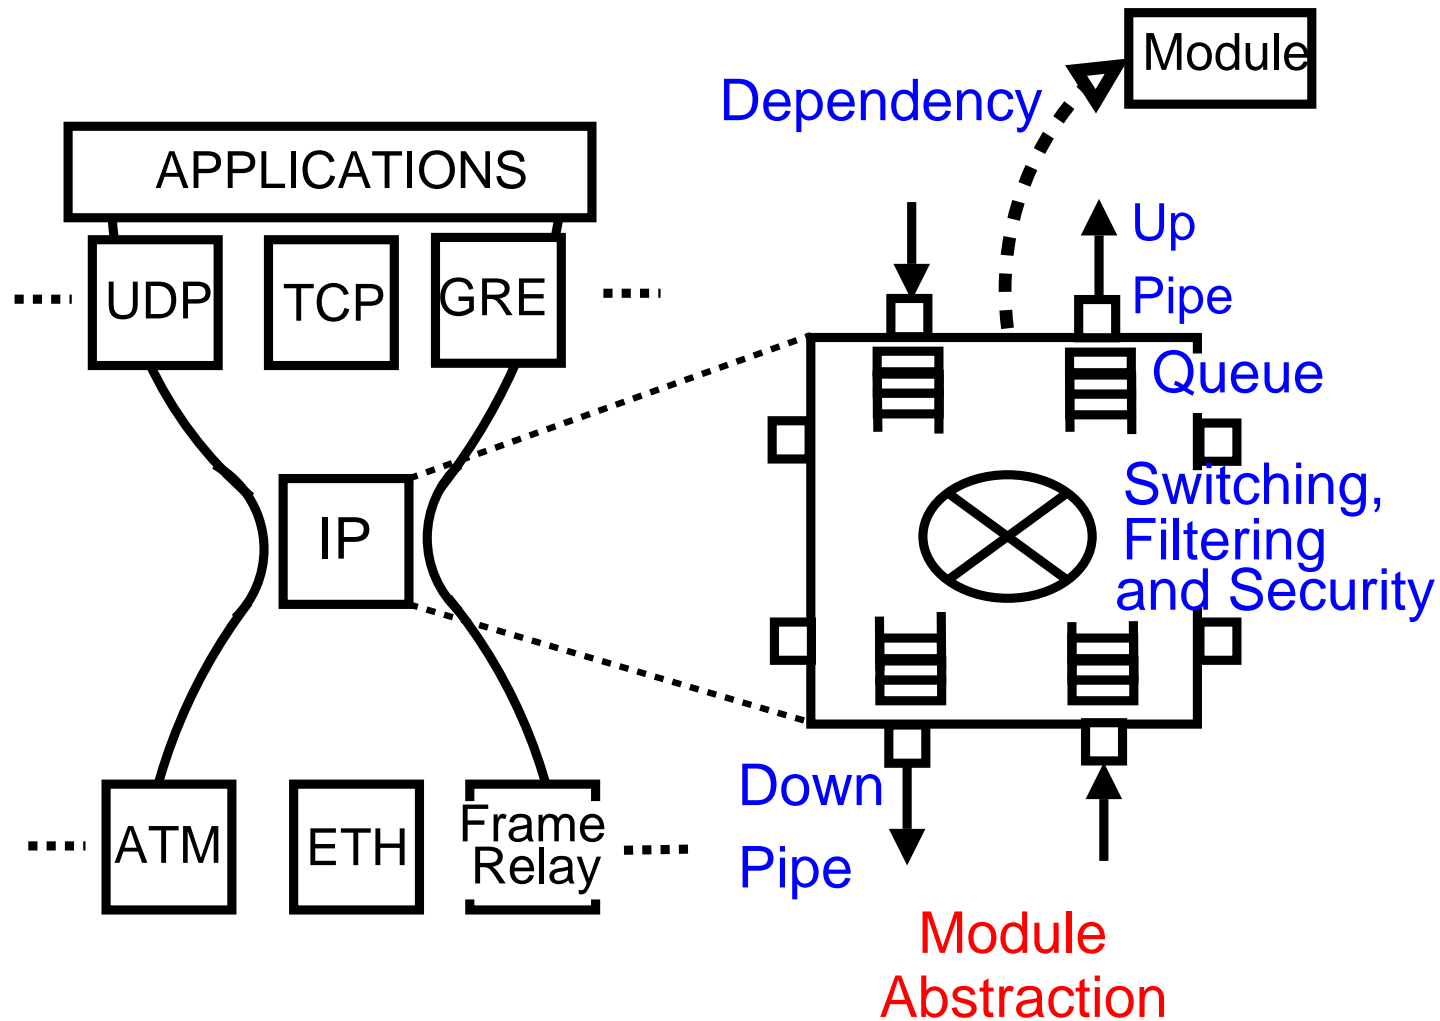

# Abstract away the details

What are these protocols modules doing?

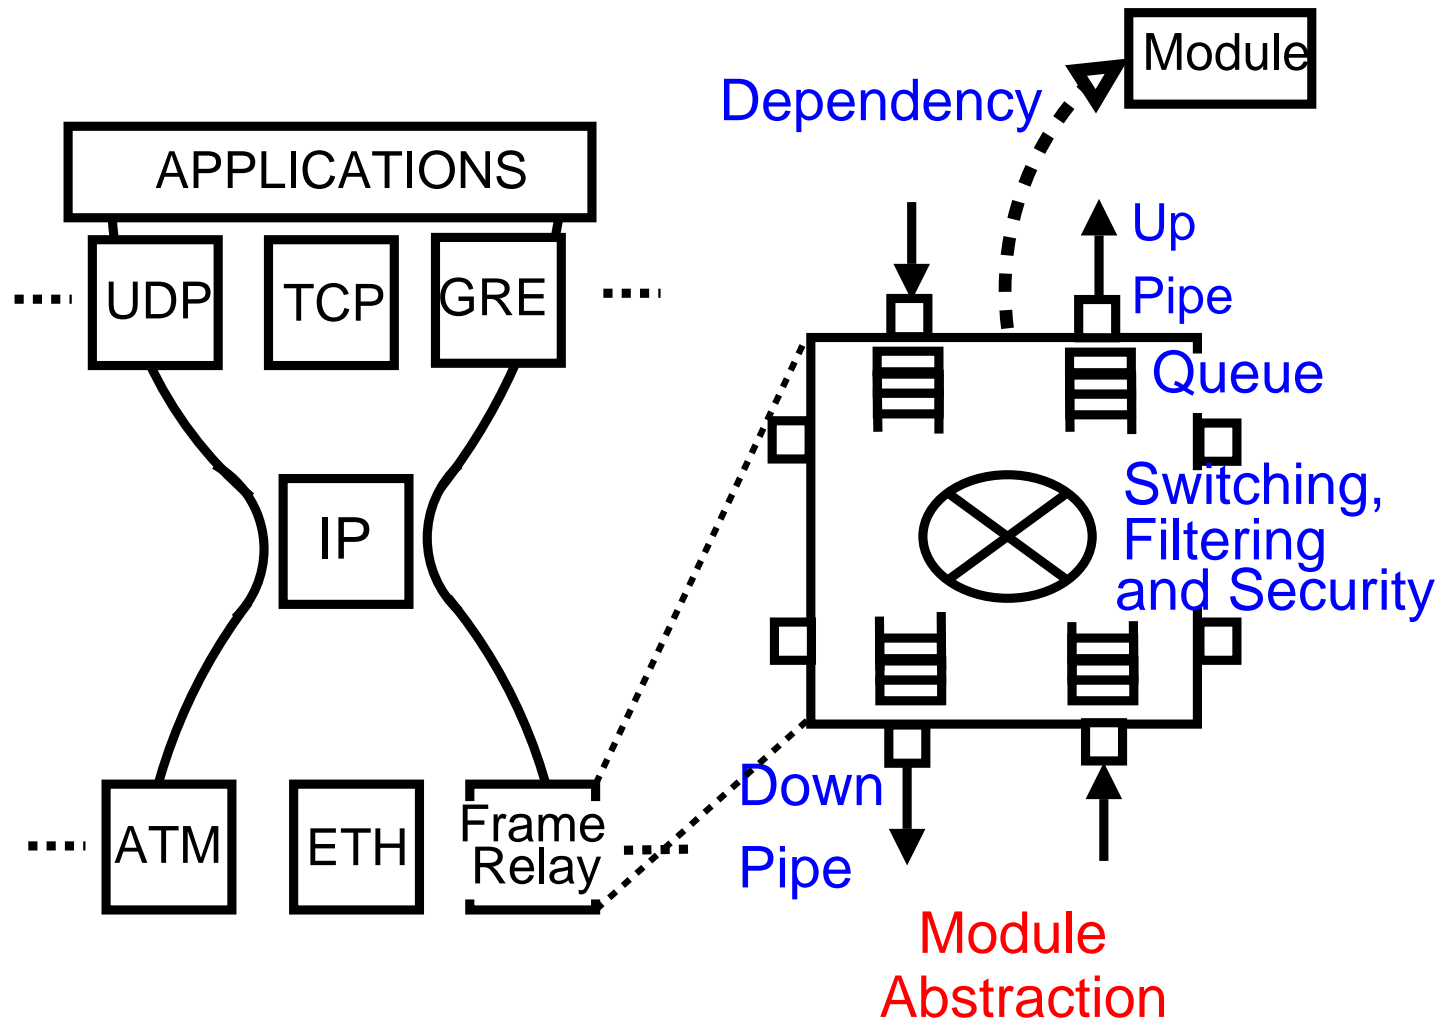

Modules may **depend** on other modules for doing their job

# Abstract away the details

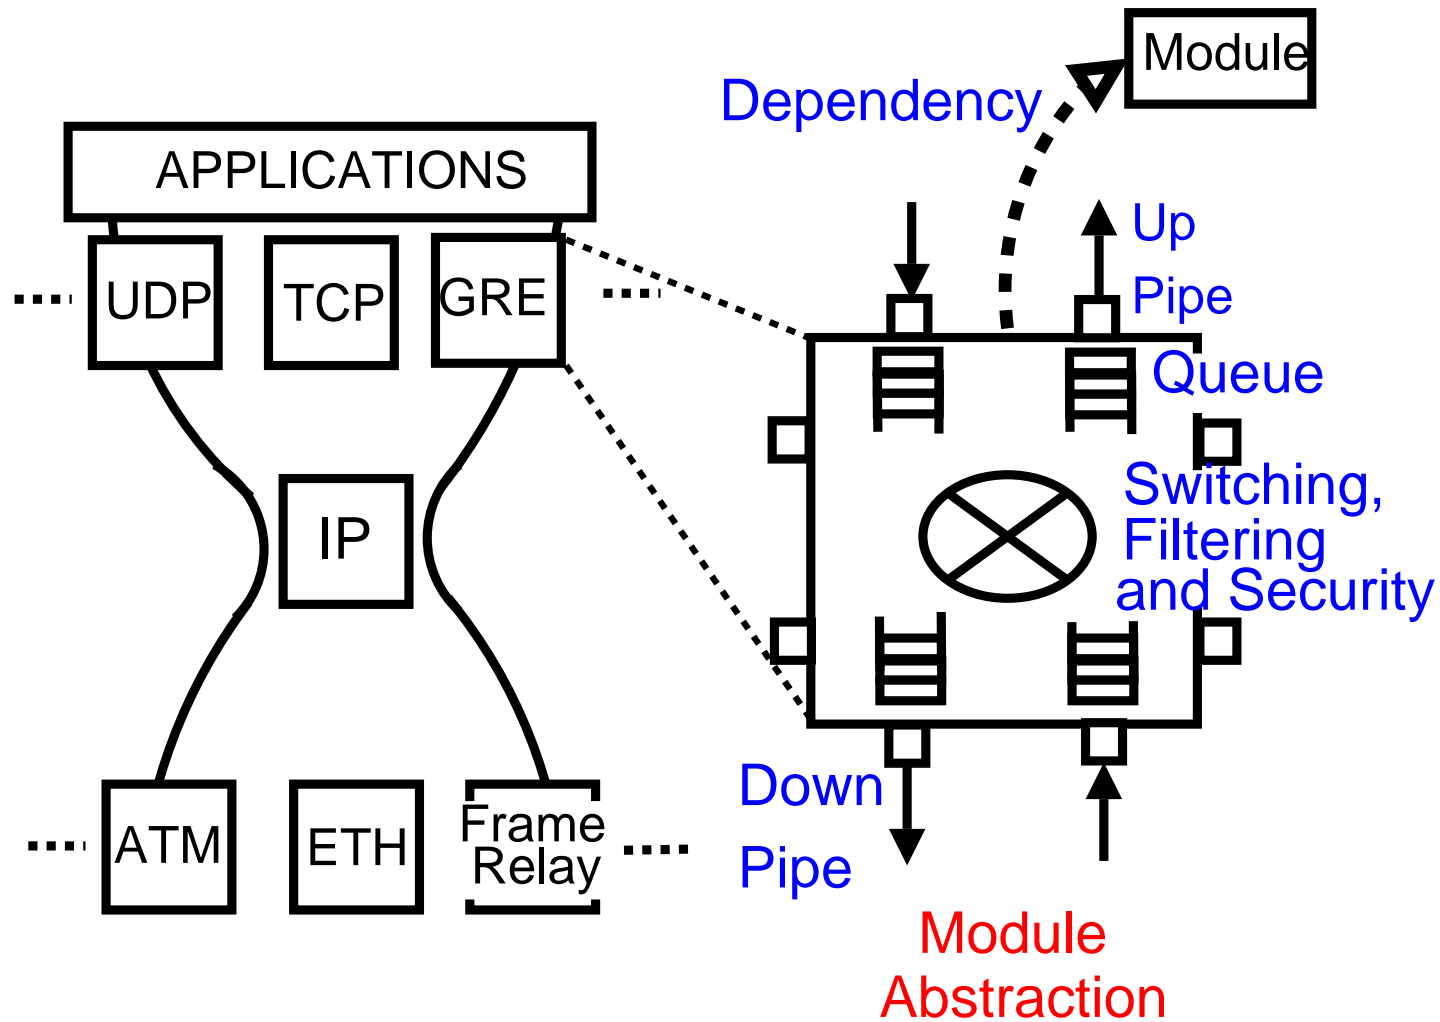

Abstraction models the capabilities and dependencies of modules

# Abstract away the details

Abstraction applies to (almost) all data plane modules

# Abstract away the details

Abstraction applies to (almost) all data plane modules

# CONMan Abstraction and Primitives

---

## Abstraction Components

- ▶ Name
- ▶ Up Pipes
- ▶ Down Pipes
- ▶ Physical Pipes
- ▶ Filter
- ▶ Switch
- ▶ Perf. Reporting
- ▶ Perf. Trade-off
- ▶ Security

## CONMan primitives

- ▶ *show*
- ▶ *create*
- ▶ *conveyMessage*
- ▶ *test*

# Exceptions to the abstraction

---

## Protocol details that need to be exposed

- ▶ IP address assignment
- ▶ Filtering based on regular expressions in HTML
- ▶ Broadcast suppression on switch ports

# An example scenario : GRE Tunneling

```
#!/bin/bash
# Inserting the GRE-IP kernel module
insmod /lib/modules/2.6.10-1/ip_gre.ko
# Creating the GRE module with the appropriate key
ip tunnel add name greA mode remote 128.84.223.112 local \
128.84.222.111 ikey 2001 okey 1001 icsum ocsum iseq oseq
ifconfig greA 192.168.1.3
# Enable routing
echo 1 > /proc/sys/net/ipv4/ip-forward
# Create IP routing state from customer to tunnel
echo 202 tun-1-2 > /etc/iproute2/rtables
ip rule add iff eth0 table tun-1-2
ip route add default dev greA table tun-1-2
# Create IP routing state from tunnel to customer
echo 203 tun-2-1 > /etc/iproute2/rtables
ip rule add iff greA table tun-2-1
ip route add default dev eth0 table tun-2-1
```

Configuration  
at Router A  
"Today"

# An example scenario : GRE Tunneling

```
#!/bin/bash
# Inserting the GRE-IP kernel module
insmod /lib/modules/2.6.10-1/ip_gre.ko
# Creating the GRE module with the appropriate key
ip tunnel add name greA mode remote 128.84.223.112 local \
128.84.222.111 ikey 2001 okey 1001 csum ocsum iseq oseq
ifconfig greA 192.168.1.3
# Enable routing
echo 1 > /proc/sys/net/ipv4/ip-forward
# Create IP routing state from customer to tunnel
echo 202 tun-1-2 > /etc/iproute2/rtables
ip rule add iff eth0 table tun-1-2
ip route add default dev greA table tun-1-2
# Create IP routing state from tunnel to customer
echo 203 tun-2-1 > /etc/iproute2/rtables
ip rule add iff greA table tun-2-1
ip route add default dev eth0 table tun-2-1
```

End-point IP  
Addresses

Key  
Values

Configuration  
at Router A  
"Today"

# An example scenario : GRE Tunneling

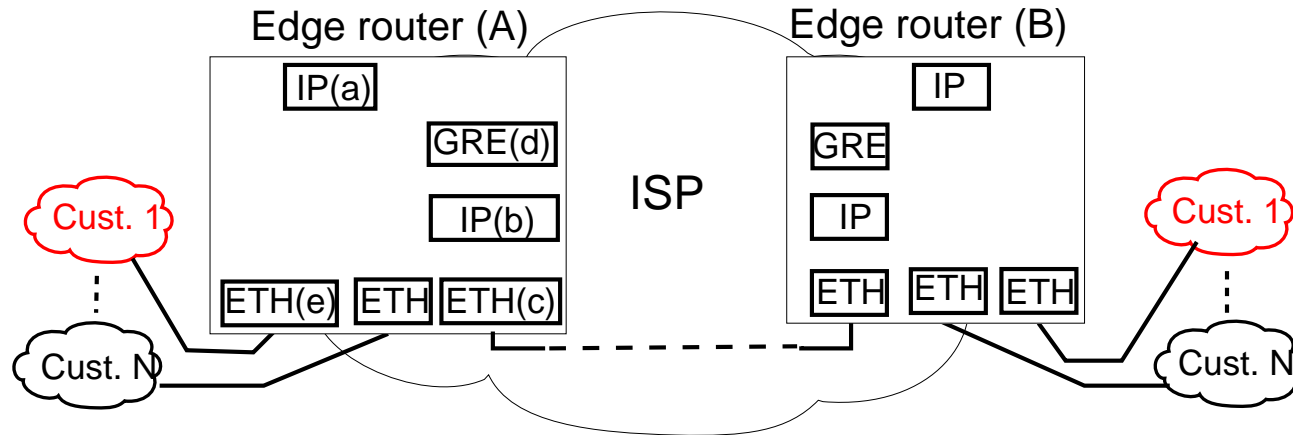

---

CONMan Goal: “Create virtual connectivity between the customer-side interfaces for Customer-1”

# An example scenario : GRE Tunneling

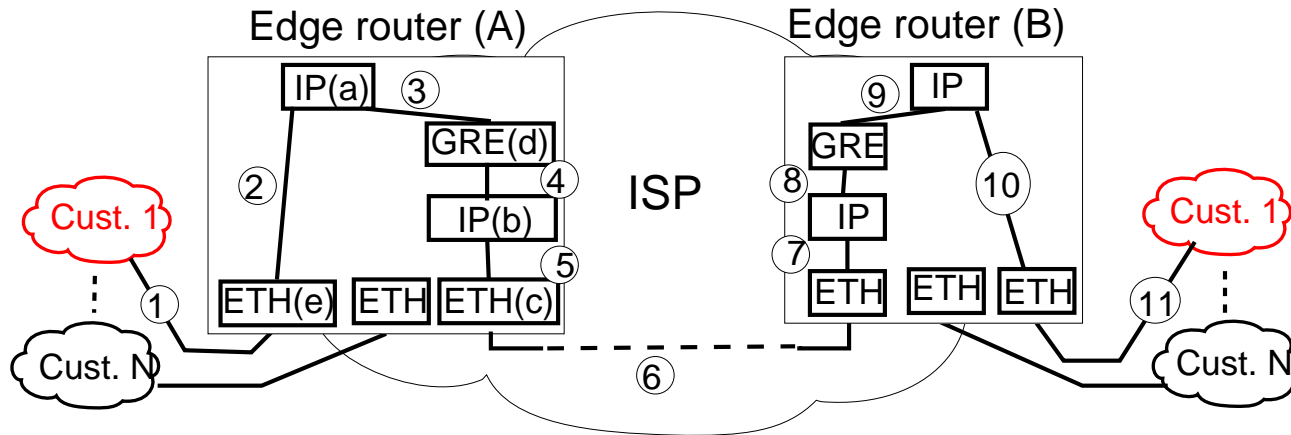

---

**NM** discovers routers through the management channel

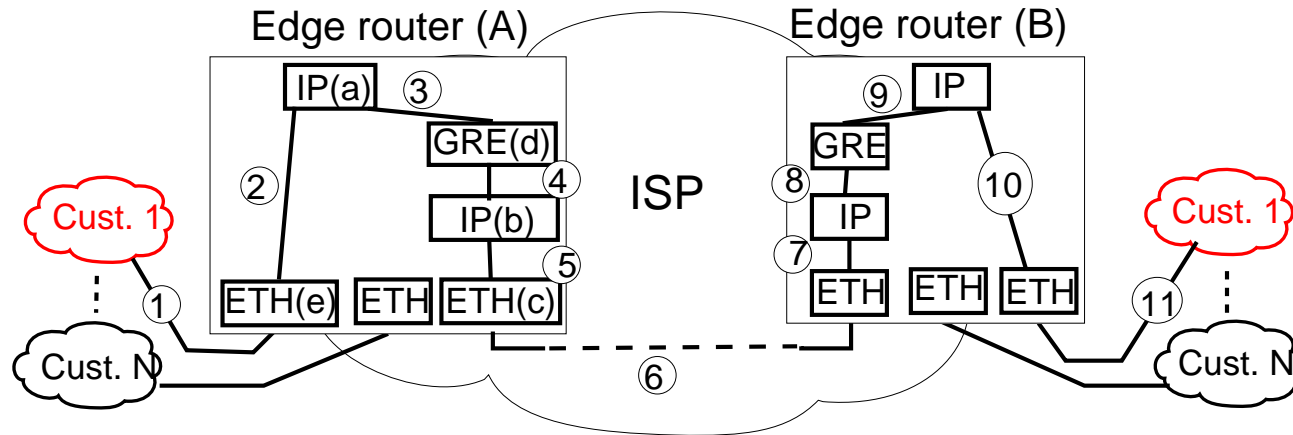

Uses *show* to determine the abstraction for the modules

# An example scenario : GRE Tunneling

Map the high-level goal to the construction of path labeled (1) through (11)

# An example scenario : GRE Tunneling

```
create (pipe, e, a)
create (pipe, a, d)
create (switch-state, a, pipe-2, pipe-3)
create (pipe, d, b)
create (pipe, b, c)
```

Configuration  
at Router A  
with CONMan

# An example scenario : GRE Tunneling

GRE Modules use conveyMessage to exchange key values, seq numbers, etc.

create (pipe, e, a)

create (pipe, a, d)

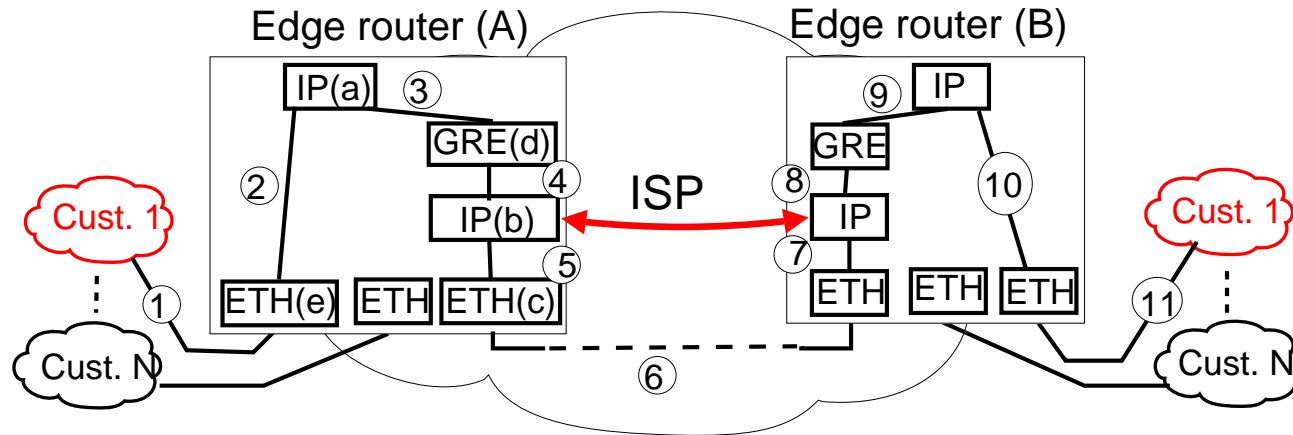

create (switch-state, a, pipe-2, pipe-3)

create (pipe, d, b)

create (pipe, b, c)

Configuration  
at Router A  
with CONMan

# An example scenario : GRE Tunneling

create (pipe, e, a)

create (pipe, a, d)

create (switch-state, a, pipe-2, pipe-3)

create (pipe, d, b)

create (pipe, b, c)

IP modules use conveyMessage  
to exchange and test IP addresses

Configuration  
at Router A  
with CONMan

# Conclusion

---

- ▶ **CONMan** : a coherent network management architecture
- ▶ Moves operational complexity of protocols to their implementation

## Protocols and devices modelled

- ▶ GRE protocol (tunnel configuration)
- ▶ IP protocol (performance management)
- ▶ Layer-2 switches (VLANs, VLAN tunneling, etc.)

# Work in progress

---

## Open Issues

- ▶ Evaluation strategies
- ▶ Scalability, performance and reliability issues
- ▶ Impact on security
- ▶ Deployment strategies
- ▶ ...
